Summary

Application Development graduate who builds integration-heavy systems, including two live client sites, a Next.js and Supabase team platform deployed on Vercel, and LLM-powered tools built on the Claude API and local models. Brings a program management background in cross-functional delivery, with experience escalating issues to engineering and product partners with clear root-cause context.

Core Skills

Data & Analytics

- SQL with PostgreSQL, SQLite, and MongoDB; Snowflake through coursework
- Supabase: Postgres, Auth, Row-Level Security, Realtime, Storage
- Data modeling for web apps: user accounts, permissions, status tracking

Cloud & AI

- Hosting and serverless: Vercel, Netlify Functions, Vultr VPS
- Claude API and local LLMs (Ollama), including cloud-to-local fallback
- CI/CD pipelines with GitHub Actions

Development

- TypeScript, JavaScript, Python, SQL
- Node.js, Express, Next.js, React, FastAPI
- REST APIs, webhooks, and third-party integrations
- Automated testing (Node test runner, pytest)

Cross-Functional

- Stakeholder alignment across engineering, product, and design
 - Risk identification, escalation, and status reporting
 - Requirements, acceptance criteria, and architecture documentation
 - Technical presentations to non-technical audiences
-

Experience

Founder / Product & Engineering Lead | Workflow Automation Platform: Flowarden (Capstone)

North Seattle College | 2026

- Scoped the MVP from a board automation already in production use, generalizing it into configurable rules and user-defined workflows.
- Designed and built a GitHub App workflow automation platform (TypeScript, Express 5, Next.js) with HMAC-verified webhooks, a payload normalization layer, and a deterministic rules engine.
- Built a repo-scoped Workflow Builder API with Zod validation and conflict detection, covered by about 40 unit and integration tests.
- Delivered all 7 planned epics on an 11-week schedule through GitHub Projects v2, with 7 architecture and API contract docs and a dependency-ordered post-MVP roadmap.

Technical Program Manager | Application Development Practicum

North Seattle College | 2024–2025

- Partnered with PMs and technical leads across 15 to 20 engineers per quarter on multiple concurrent development projects.
- Built a GitHub Actions workflow, executed by an org GitHub App with short-lived tokens, that moves Project v2 cards across five statuses on issue, PR, and review events; deployed across all active NextWaveDev and Seattle Colleges repositories, cutting PM board coordination overhead by roughly 50%.
- Identified and escalated delivery risks early, bringing structured status updates, root-cause context, and mitigation plans to leadership.
- Served as liaison between Application Development and Art departments, keeping design and engineering work synchronized through presentations and feedback sessions.

Founding Board Member & Secretary | NextWaveDev

Nonprofit Organization | 2024–Present

- Co-founded a nonprofit organization delivering software solutions for community and creative partners.
- Delivered two live client sites as primary developer: drawtheblock.org (Astro, Decap CMS), where non-technical staff manage 50+ vendor profiles and 13+ events on their own, and a custom Shopify storefront for Card Cave Games.
- Configured infrastructure for nextwavedev.org, including DNS, email, and OAuth, and set up Stripe for client invoicing.
- Authored a tiered client services framework defining scope, expectations, and delivery models for prospective partners.

Projects

NextWaveDev Client Portal | Next.js, Supabase, Vercel

- Contributed to a role-based platform connecting nonprofit contractors, clients, and admins, building the proposal review lifecycle and a shared project workspace across all three dashboards.
- Moved proposal data from browser localStorage to authenticated Supabase Postgres behind Row-Level Security.

Job-Finder | Netlify Functions, Supabase, Claude API

- Built a job-search pipeline that aggregates postings from 5 job APIs (Greenhouse, Lever, Ashby, USAJOBS, Adzuna) and 70+ companies into one normalized schema, with repost detection and source-failure logging.
- Integrated Claude Haiku for high-volume job-fit scoring tracked per resume version, with Supabase Row-Level Security and Realtime sync across devices.

Chao Companion AI | Python, Claude, Ollama, FastAPI

- Built a real-time AI companion character combining speech-to-text, Claude and local Ollama LLMs, a custom-trained Piper voice, Twitch chat, and VTube Studio animation, covered by 396 automated tests.
- Designed a zero-VRAM architecture around a written hardware budget and a sub-1.5 second latency target, with a circuit breaker that falls back from the cloud LLM to a local model.

Education

Bachelor of Applied Science (BAS), Application Development

North Seattle College | Seattle, WA

Graduated June 2026

Focus: Software Development Lifecycle, Project Management, Databases, Web Applications, Mobile Development

Associate of Applied Science (AAS-T)

North Seattle College | Seattle, WA
